

The OKERO DMXplorer is a pocket sized DMX tool with advanced transmit functions. A reliable DMX source is a must for a light technician checking the rig, aligning scrollers etc. DMXplorer also doubles up as a 24 channel mini light desk with 80 presets.

BRIEF

DMXplorer will make your life a lot easier when aligning scrollers, checking dimmers, setting up moving lights etc. DMXplorer is a tool for every light technician who want a reliable DMX512 source at any time, anywhere. The use of a fader gives a more direct control compared to increasing and decreasing a level with buttons.

You can control single channels and set the level with the fader, all channels with fader, auto step channel with fader and so on. See the function list for more functions.

You can also build 80 presets with 24 channels and use the fader as a X-fade or as Speed control. Using the Auto jump option, you can build a self running sequence easily. All your presets are stored in a non volatile memory and can be recalled at any time.

Several user options are available like different DMX speeds, backlight on, off, auto off, user level etc. All settings can be stored to be auto loaded when switched on.

FEATURES

- Low cost
- Ease of use
- Small size
- Basic and advanced transmit functions
- Build, save and use presets
- Use of fader
- Possible to operate in total darkness
- Battery use for portability (9V)
